Finance for Managers

Pablo Fernandez
Professor of Finance. IESE Business School, University of Navarra
Camino del Cerro del Aguilà 3. 28023 Madrid, Spain
e-mail: fernandezpa@iese.edu

The first section (from accounting to corporate finance) answers the following questions: What is the net income? Is it what the shareholders “earn”, what the company “earns”, what someone “earns”? What does shareholders’ equity mean? Is it money? We show that net income is an arbitrary number which depends on several decisions on the accounting of expenses and revenues. We use three different definitions of cash flow: equity cash flow (ECF), free cash flow (FCF) and capital cash flow (CCF) and answer to the question: When is net income equal to the equity cash flow?

The second section (shareholder value creation and shareholders return) defines, analyzes and calculates shareholder value creation. It also differentiates the expected return from the required return. The all-shareholder return is the return that all the shareholders of a company had in a period. It is equal to the hypothetical return of a unique shareholder of the company. It is also the return of a shareholder that always had a constant proportion of the shares. The all-period shareholder return is the return that a shareholder that maintained the shares for the whole period had. There are many all-period shareholder returns, depending on the actions of the shareholder during the period: fraction of dividends reinvested, fraction of shares sold when the company repurchased them, number of shares subscribed when the company increased capital… Most databases provide a specific all-period shareholder return valid for a shareholder that reinvested 100% of the dividends, did not sell any share in repurchases and did not subscribe any new share when the company increased capital. In many situations, there are substantial differences among these returns.

The third section (topics and real cases on valuation) shows that It is a big mistake to use betas calculated from historical data to compute the required return to equity for seven reasons. It also shows two real valuation cases of companies.

The fourth section (other finance and investing topics) shows that the Market Portfolio is not efficient and that it was very easy to beat the S&P500 in 2000-2018. It also shows confusions, errors and inconsistencies of several Utilities Regulators when they calculate WACCs using CAPM.

Keywords: Value, Price, Free cash flow, Equity cash flow, Capital cash flow, Book value, Market value, PER, Goodwill, Required return to equity, Working capital requirements

JEL Classification: G12, G31, M21

**Tables and figures** are available in excel format with all calculations on:

This book contains materials of the MBA and executive courses that I teach that are not included in my book [Valuation and Common Sense](http://ssrn.com/abstract=2209089).

I dedicate this book to my wife Lucia and my parents for their on-going encouragement, invaluable advice and a constant example of virtues: hope, fortitude, good sense… I am very grateful to my children Isabel, Pablo, Paula, Juan, Lucia, Javier and Antonio for being, in addition to many other things, a source of joy and common sense.

This book would never have been made possible without the excellent work done by a group of students and research assistants, namely José Ramón Contreras, Teresa Modroño, Gabriel Rabasa, Laura Reinoso, Jose Mª Carabias, Vicente Bermejo, Javier del Campo, Luis Corres, Pablo Linares, Isabel Fernandez-Acin, Alberto Ortiz, Vitaly Pershin and Mar Martínez. It has been 29 years since we began and their contribution has been essential.

I want to thank my dissertation committee at Harvard University, Carliss Baldwin, Timothy Luehrman, Andreu Mas-Colell and Scott Mason for improving my dissertation as well as my future work habits. Special thanks go to Richard Caves, chairman of the Ph.D. in Business Economics, for his time and guidance. Some other teachers and friends have also contributed to this work. Discussions with Franco Modigliani, John Cox and Frank Fabozzi
(from M.I.T.), and Juan Antonio Palacios were important for developing the ideas which have found a significant place in this book.

I thank Vicente Font (Professor of Marketing at IESE) and don José María Pujol (Doctor and Priest) for being wonderful teachers of common sense.

Lastly, I express my gratitude to the Deans of IESE Carlos Cavallé (for hiring me), Jordi Canals (for not firing me) and Franz Heukamp (also, for not firing me), and to all the persons working at IESE. For me, it has been a privilege working at IESE for 34 years: for the human quality of its employees and for being the Business School with the clearest mission and with the clearest conception of what is a human person.

Contents

FROM ACCOUNTING TO CORPORATE FINANCE

Ch101 Meaning of the P&L and of the Balance Sheets: Madera Inc

Ch102 Net Income, cash flows, reduced balance sheet and WCR (Working Capital Requirements)
1. Financial statements of Madera Inc. 2. Accounting cash flow, equity cash flow, debt cash flow, free cash flow and capital cash flow. 3. Transformation of accounting into collections and payments. 4. Analysis of the collection from clients, payments to suppliers and Inventory. 4.1. Collection period. 4.2. Payment period. 4.3. Days of Inventory. 4.4. Gross Margin of the company. 4.5. Linking payments, collections, inventory and gross margin. 5. The reduced balance. WCR ("Working Capital Requirements”).

Exhibits 1. Reduced balance for 12 US companies. 2. Synonyms and confusion of terms. 3. Balance sheet and P&L of Coca Cola, Pepsico, IBM, Microsoft, Google, and GE.

Ch103 Meaning of Net Income and Shareholders’ Equity
1. History of Madera Inc. 2. Reduced balance sheets of Madera Inc. 3. Impact of the change in the shareholder structure of Madera Inc. 4. Issues that may affect the net income of 2012. 5. Different figures of net income and shareholders’ equity that Madera Inc. could have reported for 2012. 6. These accounting changes do NOT change “cash and equivalents” or financial debt or cash flows. 7. Questions for the reader.

Exhibits 1. Evolution of the reduced balance of Madera Inc. 2. Evolution of the reduced balance of Inditex.

Ch104 Cash flow is a Fact. Net income is just an opinion
1. Net income is just an opinion, but cash flow is a fact. 2. Accounting cash flow, equity cash flow, free cash flow and capital cash flow. 3. Calculating the cash flows. 4. A company with positive net income and negative cash flows. 5. When is profit after tax a cash flow? 6. When is the accounting cash flow a cash flow? 7. Equity cash flow and dividends. 8. Recurrent cash flows. 9. Attention to the accounting and the managing of net income

SHAREHOLDER VALUE CREATION AND SHAREHOLDERS RETURN

Ch111 Shareholder Value Creation: A Definition
1. Increase of equity market value. 2. Shareholder value added. 3. Shareholder return. 4. Difference between all-shareholders return and shareholder return. 5. Required return to equity. 6. Created shareholder value. 7. The ROE is not the shareholder return. 8. What should the shareholder return be compared with?

1. Definition of created shareholder value. 2. Shareholder value creation of the S&P 500. 3. Shareholder value creators and Shareholder value destroyers

Ch113 EVA and Cash value added do NOT measure shareholder value creation
1. Accounting-based measures cannot measure value creation. 2. EVA does not measure the shareholder value creation by American companies. 3. The CVA does not measure the shareholder value creation of the world’s 100 most profitable companies. 4. Usefulness of EVA, EP and CVA. 4.1. The EVA, the EP and the CVA can be used to value companies. 4.2. EVA, EP and CVA as management performance indicators

Exhibit 1. Correlation of increase of MVA with EVA and with the increase of EVA, and market value (MV) in 1997

Ch114 Expected and Required returns: very different concepts

Ch115 All-shareholder return, All-period returns and Total Index Return
1. Different groups of shareholders of a company. 2. Returns of the different groups of shareholders of a company: Three examples. 3. A more complicated example. 4. Which return is the most relevant?

TOPICS AND REAL CASES ON VALUATION

Ch121 Betas used by Professors: a survey with 2,500 answers
1. Betas used by professors. 2. Dispersion of the betas provided by webs and databases
3. Schizophrenic approach to valuation
4. Problems estimating the betas. 4.1. Calculated betas change considerably from one day to the next. 4.2. Calculated betas change considerably with the time period, frequency and index chosen as reference. 4.3. Which company has a higher beta? 4.4. Implications for constructing beta-ranked portfolios. 4.5. High-risk companies very often have lower historical betas than low-risk companies. 4.6. Industry betas vs. company betas. 4.7. \( \beta = 1 \) has a higher correlation with stock returns than calculated betas
5. Calculating the required return to equity without regressions
6. Calculating a qualitative beta. 7. Errors using calculated betas for the valuation. 8. Conclusion
Exhibit 1. Mail sent on April 2009. Exhibit 2. Main results of the survey. Details by country. Exhibit 3. 89 comments of professors that use calculated betas. Exhibit 4. 8 comments of professors that use “common sense” betas. Exhibit 5. 62 comments of professors that do not use betas. Comments to the chapter

Ch122 On the instability of betas
1. Betas calculated from historical data vary considerably from one day to the next. 2. The calculated betas depend on which stock market index is taken as a reference. 3. The calculated betas depend on what historical period is used. 4. The calculated betas depend on what returns (monthly, daily…) are used. 5. It is difficult to say whether the beta of one company is bigger or smaller than the beta of another. 6. There is little correlation between calculated betas and stock returns. 7. Calculating a qualitative beta. 8. Conclusion

Ch123 Valuation of the shares after an expropriation: the case of ElectraBul

Ch124 A solution to Valuation of the Shares after an Expropriation: The Case of ElectraBul
1. Preliminary Analysis of the “VERAVAL Valuation”
   1.1. Comparison of the Valuation with ElectraBul Dividends. 1.2. Comparison with the Profits Expected by the “VERAVAL Valuation” Itself. 1.3. Comparison with Multiples from other Companies in Similar Industries
2. Valuation Using ALL Data Contained in the “VERAVAL Valuation”
   2.1. Main Data of the “VERAVAL Valuation”. 2.2. Valuation Using the “Adjusted Present Value” (APV) Method. 2.3. Valuation Using the WACC. 2.4. Valuation Given that the Projections were made in 2010 constant dollars. 2.5. Comparison of the Valuation with Similar Company Multiples
3. Valuation Using ALL Data Contained in the “VERAVAL Valuation” Except the Country Risk Premium
4. “VERAVAL Valuation” Misconceptions
   4.1. The Present Value of the Cash Flows is miscalculated. 2. Ke is miscalculated. 3. The WACC is miscalculated. 4. Does not take into account that Forecasts are expressed in 2010 Constant Dollars. 5. The Country Risk Used is high. 6. The Book Value of the Shares is miscalculated. 7. The Beta of Shares is miscalculated
5. Conclusion
Ch125 Valuation of an expropriated company: The case of YPF and Repsol in Argentina
1. Short history of Repsol in YPF. 2. The months before the expropriation. 3. Precedent transactions of YPF shares
4. Analyst reports about YPF. 5. Vaca Muerta: a huge oil and gas shale. 6. YPF's bylaws valuation methodology
7. Cash Flows of Repsol due to its investment in YPF

Ch126 1,959 valuations of the YPF shares expropriated to Repsol
1. 2,023 answers until February 22, 2013. 2. Distribution of the answers. 3. Answers by country. 4. Answers by respondent. 5. Dispersion and frequency of the answers. 6. Comments of some answers that provided a figure. 7. Comments of some answers that did not provide a figure

Ch127 Three Residual Income Valuation Methods and Discounted Cash Flow Valuation
1. Economic profit (EP) and MVA (market value added = Equity market value – Equity book value)
2. EVA™ (economic value added) and MVA (market value added)
3. CVA (cash value added) and MVA (market value added)
4. First valuation. Investment without value creation. 5. Usefulness of EVA, EP and CVA
5. Second valuation. Investment with value creation. 7. Conclusions

Ch128 Which is the Right ‘Market Beta’? 1,385 US Companies and 147 Betas/Company in a Single Date
1. Great dispersion of the calculated betas on a single date
2. Which company had a higher beta on March 31, 2014?
3. Beta ranking: also great dispersion
4. Betas calculated with daily, weekly or monthly returns
5. Correlation of the returns with the calculated betas and other parameters
6. Returns of portfolios formed according to Fama-French (1992)
7. Conclusion
Exhibit 1. Summary of the 147 calculated betas for each company on March 31, 2014. 47 biggest companies by market cap

OTHER FINANCE AND INVESTING TOPICS

Ch131 The Market Portfolio is NOT efficient: Evidences, consequences and easy to avoid errors
1. Unweighted (equal weighted) indexes have outperformed their “value-weighted indexes”. 2. The Market Portfolio is not an efficient portfolio. 3. Volatility or beta are bad measures of risk. 4. About the unhelpfulness of the Sharpe ratio. 5. About the CAPM. 6. The size effect in Fama-French. 7. Common errors in portfolio management and corporate finance.
3. FTSE 100 Equally Weighted Index 10. Ernst, Thompson and Miao (2016)
4. MSCI WORLD Equal Weighted Index (USD) 11. Fama and French (2015, 1992)
5. MSCI USA Equal Weighted Index 12. Bodie and Merton (2000); and Bodie, Merton and Cleeton (2009)

Ch132 It Has Been Very Easy to Beat the S&P500 in 2000-2018: Several Examples
1. Rational Investors in equities
2. Four portfolios that have outperformed the S&P500
3. Similar results for portfolios of companies in Spain
4. “Academic literature” and “professional advisors” on investing: much confusion and not much rationality
5. Conclusion
Exhibit 2. S&P500 Equal Weighted Index
Exhibit 3. Charts that help to analyze the historical return of some traded US companies
Exhibit 4. Definitions provided by Datastream.
Ch 133 **Optimal Capital Structure: Problems with the Harvard and Damodaran Approaches**
1. Optimal structure according to a Harvard Business School technical note
2. Critical analysis of the Harvard Business School technical note. 2.1. Present value of the cash flows generated by the company and required return to assets. 2.2. Leverage costs. 2.3. Incremental cost of debt. 2.4. Required return to incremental equity cash flow. 2.5. Difference between Ke and Kd. 2.6. Price per share for different debt levels. 2.7. Adding the possibility of bankruptcy to the model. 2.8. Ke and Kd if there are no leverage costs. 2.9. Ke and Kd with leverage costs. 2.10. Influence of growth on the optimal structure
3. Boeing’s optimal capital structure according to Damodaran
4. Capital structure of 12 companies: Coca Cola, Pepsico, IBM, Microsoft, Google, GE, McDonald’s, Intel, Walt Disney, Chevron, Johnson & Johnson and Wal-Mart.

Ch 134 **Finance and Financial Economics: A debate**

Ch 135 **Is it Ethical to Teach that Beta and CAPM Explain Something?**
1. [Facts, evidence, real world] vs. [models, theories, opinions]. 2. Do I teach the CAPM to my students? 3. Questions for a Professor that says that CAPM explains something 4. Sharpe. Paragraphs from his foundational paper about CAPM. 5. The CAPM does not work. 6. Why so many people continue using CAPM. 7. Some consequences of using the CAPM. 8. Confusion between the expected rate of return and the required rate of return. 9. How to use betas to calculate required returns and to be a reasonable person. 10. Arbitrage Pricing Theory (APT) and smart betas. 11. Another fundamental problem: forgetting that “the market” is a group of persons. 12. An alternative to the CAPM and “smart betas”. 13. Conclusion.

**Exhibits** 1. Capital Asset Pricing Model (CAPM). 2. Some papers about the CAPM. 3. Problems with calculated betas. 4. Problems calculating the Market Risk Premium. 5. Comments of professors and executives that do not think that the "CAPM is an absurd model"

Comments from the readers

Ch 136 **WACC and CAPM According to Utilities Regulators: Confusions, Errors and Inconsistencies**
1. WACC according to a European Regulator
   1.1. Selection of the comparison group of companies. 1.2. Optimal leverage ratio. 1.3. Tax Rate (T).
   1.4. Cost of equity (Ke). 1.5. Risk-free rate (Rf). 1.6. Levered beta (βL) of each company.
   1.7. Unlevered beta (βu) of each company. 1.8. Unlevered beta of the regulated activity (βu).
   1.9. Levered beta of the regulated activity (βLR).
2. Comparison with the 2007 calculation of the WACC
3. How different regulators estimate parameters
4. What is the CAPM?
5. What is the WACC?
6. Thirty-five questions for the reader
7. Other possible results of the Regulator of section 1
8. Solutions proposed
9. Conclusion
   Exhibit 1. Selected companies by the regulators and their estimated parameters
   Exhibit 2. Some sentences of regulatory documents
   Exhibit 3. What is the WACC?  Exhibit 4. What is the CAPM?
   Exhibit 5. Nine different relationships between ßu and ßL
References.  Comments from readers

REFRESSING

Ch141  18 Topics Badly Explained by Many Finance Professors
1. Where does the WACC equation come from?
2. The WACC is not a cost
3. The WACC equation when the value of debt is not equal to its nominal value
4. The term equity premium is used to designate four different concepts
5. Textbooks differ a lot on their recommendations regarding the equity premium
6. Which Equity Premium do professors, analysts and practitioners use?
7. Calculated (historical) betas change dramatically from one day to the next
8. Why do many professors still use calculated (historical) betas in class?
9. EVA does not measure Shareholder value creation
10. The relationship between the WACC and the value of the tax shields (VTS)
11. Beta and CAPM do not explain anything about expected or required returns
12. Difference between the expected and the required rates of return
13. It has been very easy to beat the S&P500 in 2000-2018
14. Apply the logic principle “Never buy a hair growth lotion from a man with no hair” to your investment advisors… and to your professors
15. Rational investing in equities
16. Volatility is a bad measure of risk.
17. About the unhelpfulness of the Sharpe ratio.
18. Common errors in portfolio management and wrong advices
Exhibit 1. Calculating the WACC
Exhibit 2. Capital Asset Pricing Model (CAPM)
Exhibit 3. Comments from readers

Ch142  339 questions on valuation and finance
1. 100 questions with answers.  2. Short answers to the 100 questions.  3. 104 additional questions.  4. Define.
5. Define and differentiate. 6. Comments of readers to previous versions of this paper
Glossary

**Accounting cash flow.** Net Income plus depreciation.

**Adjusted Book Value** Difference between market value of assets and market value of liabilities. Also called Net Substantial Value or Adjusted Net Worth.

**Adjusted present value (APV).** The APV formula indicates that the firm value (E + D) is equal to the value of the equity of the unlevered company (Vu) plus the value of the tax shield due to interest payments.

**Arbitrage pricing theory (APT)** An asset pricing theory that describes the relationship between expected returns on securities, given that there are no opportunities to create wealth through risk-free arbitrage investments.

**Arbitrage.** The purchase and sale of equivalent assets in order to gain a risk-free profit if there is a difference in their prices.

**Arbitration** Alternative to suing in court to settle disputes between brokers and their clients and between brokerage firms.

**Benchmark** Objective measure used to compare a firm or a portfolio performance.

**Beta.** A measure of a security’s market-related risk, or the systematic risk of a security.

**Binomial option pricing model.** A model used for pricing options that assumes that in each period the underlying security can take only one of two possible values.

**Black-Scholes formula.** An equation to value European call and put options that uses the stock price, the exercise price, the risk-free interest rate, the time to maturity, and the volatility of the stock return. Named for its developers, Fischer Black and Myron Scholes.

**Book value (BV)** The value of an asset according to a firm’s balance sheet.

**Break-up Value** Valuation of a company as the sum of its different business units.

**Call Option.** Contract that gives its holder (the buyer) the right (not the obligation) to buy an asset, at a specified price, at any time before a certain date (American option) or only on that date (European option).

**Capital Asset Pricing Model (CAPM)** Equilibrium theory that relates the expected return and the beta of the assets. It is based on the mean-variance theory of portfolio selection.

**Capital Cash Flow (CCF)** Sum of the debt cash flow plus the equity cash flow.

**Capital Market line.** In the capital asset pricing model, the line that relates expected standard deviation and expected return of any asset.

**Capital structure.** Mix of different securities issued by a firm.

**Capitalization** Equity Market Value.

**Cash budget.** Forecast of sources and uses of cash.

**Cash dividend.** Cash distribution to the shareholders of a company.

**Cash Earnings (CE)** Net income before depreciation and amortization. Also called Accounting Cash Flow and Cash Flow generated by operations.

**Cash Flow Return on Investment (CFROI)** The internal rate of return on the investment adjusted for inflation.

**Cash Value Added (CVA)** NOPAT plus amortization less economic depreciation less the cost of capital employed.

**Collection period.** The ratio of accounts receivable to daily sales.

**Company’s value (VL)** Market value of equity plus market value of debt.

**Constant growth model.** A form of the dividend discount model that assumes that dividends will grow at a constant rate.

**Consumer Price Index** Measures the price of a fixed basket of goods bought by a representative consumer.

**Convertible debentures** Bonds that are exchangeable for a number of another securities, usually common shares.

**Correlation Coefficient** The covariance of two random variables divided by the product of the standard deviations. It is a measure of the degree to which two variables tend to move together.

**Cost of capital.** The rate used to discount cash flows in computing its net present value. Sometimes it refers to the WACC and other times to the required return to equity (Ke).

**Cost of Leverage** The cost due to high debt levels. It includes the greater likelihood of bankruptcy or voluntary reorganization, difficulty in getting additional funds to access to growth opportunities, information problems, and reputation…

**Covariance.** It is a measure of the degree to which two asset returns tend to move together.

**Credit Rating** Appraisal of the credit risk of debt issued by firms and Governments. The ratings are done by private agencies as Moody’s and Standard and Poor’s.

**Credit Risk.** The risk that the counterpart to a contract will default.

**Cumulative preferred stock.** Stock that takes priority over common stock in regard to dividend payments. Dividends may not be paid on the common stock until all past dividends on the preferred stock have been paid.

**Current asset.** Asset that will normally be turned into cash within a year.

**Current liability.** Liability that will normally be repaid within a year.

**Debt Cash Flow (CFd)** Sum of the interest to be paid on the debt plus principal repayments.

**Debt’s Market Value (D)** Debt Cash Flow discounted at the required rate of return to debt (may be different than the Debt's book value).

**Debt’s book value (N)** Debt value according to the balance sheet.

**Default risk.** The possibility that the interest of the principal of a debt issue will not be paid.
Default Spread Difference between the interest rate on a corporate bond and the interest rate on a Treasury bond of the same maturity.

Depreciation (Book) Reduction in the book value of fixed assets such as plant and equipment. It is the portion of an investment that can be deducted from taxable income.

Depreciation (Economic) ED (economic depreciation) is the annuity that, when capitalized at the cost of capital (WACC), the assets’ value will accrue at the end of their service life.

Derivative Financial instrument with payoffs that are defined in terms of the prices of other assets.

Discounted dividend model (DDM) Any formula to value the equity of a firm by computing the present value of all expected future dividends.

Discounted value of the tax shields (DVTS) Value of the tax shields due to interest payments.

Dispersion Broad variation of numbers.

Diversifiable risk The part of a security’s risk that can be eliminated by combining it with other risky assets.

Diversification principle The theory that by diversifying across risky assets investors can sometimes achieve a reduction in their overall risk exposure with no reduction in their expected return.

Dividend payout ratio (p) Percentage of net income paid out as dividends.

Dividend yield Annual dividend divided by the share price.

Duration A measure of the sensitivity of the value of an asset to changes in the interest rates.

Earnings Per Share (EPS) Net Income divided by the total number of shares.

Economic Balance Sheet Balance sheet that has in the asset side working capital requirements.

Economic Profit (EP) Profit after tax (net income) less the equity’s book value multiplied by the required return to equity.

Economic Value Added (EVA) NOPAT less the firm’s book value multiplied by the average cost of capital (WACC) and other adjustments implemented by the consulting firm Stern Stewart.

Efficient portfolio Portfolio that offers the highest expected rate of return at a specified level of risk. The risk may be measured as beta or volatility.

Enterprise value (EV) Market value of debt plus equity

Equity Book Value (Ebv) Value of the shareholders’ equity stated in the balance sheet (capital and reserves). Also called Net Worth.

Equity Cash Flow (ECF) The cash flow remaining available in the company after covering fixed asset investments and working capital requirements and after paying the financial charges and repaying the corresponding part of the debt’s principal (in the event that there exists debt).

Equity Market Value (E) Value of all of the company’s shares. That is each share’s price multiplied by the number of shares. Also called Capitalization.

Equity value generation over time Present value of the expected cash flows until a given year.

Exercise price Amount that must be paid for the underlying asset in an option contract. Also called strike price.

Fixed-income security A security such as a bond that pays a specified cash flow over a specific period.

Franchise Factor (FF) "Measures what we could call the growth’s “quality”, understanding this to be the return above the cost of the capital employed."

Free Cash Flow (FCF) The operating cash flow, that is, the cash flow generated by operations, without taking into account borrowing (financial debt), after tax. It is the equity cash flow if the firm had no debt.

Goodwill Value that a company has above its book value or above the adjusted book value.

Gross domestic product (GDP) Market value of the goods and services produced by labor and property in one country including the income of foreign corporations and foreign residents working in the country, but excluding the income of national residents and corporations abroad.

Growth (g) Percentage growth of dividends or profit after tax.

Growth Value The present value of the growth opportunities.

Homogenous expectations Situation (or assumption) in which all investors have the same expectations about the returns, volatilities and covariances of all securities.

IBEX 35 Spanish stock exchange index

Interest Factor The PER the company would have if it did not grow and had no risk. It is -approximately- the PER of a long-term Treasury bond.

Internal rate of return (IRR) Discount rate at which an investment has zero net present value.

Leverage ratio Ratio of debt to debt plus equity

Leveraged buyout (LBO) Acquisition in which a large part of the purchase price is financed with debt.

Levered beta (bL) Beta of the equity when the company has debt.

Levered Free Cash Flow (LFCF) Equity cash flow

Liquidation Value Company’s value if it is liquidated, that is, its assets are sold and its debts are paid off.

Market portfolio The portfolio that replicates the whole market. Each security is held in proportion to its market value.

Market risk (systematic risk) Risk that cannot be diversified away.

Market Value Added (MVA) The difference between the market value of the firm’s equity and the equity’s book value.

Market Value of Debt (D) Market Value of the Debt
Market-to-book ratio (E/Ebv) It is calculated by dividing the equity market value by the equity book value.

Net Operating Profit After Tax (NOPAT) Profit after tax of the unlevered firm.

Non systematic risk. Risk that can be eliminated by diversification. Also called unique risk or diversifiable risk.

Par value. The face value of the bond.

Pay in Kind (PIK) Financial instruments that pay interest or dividends using new financial instruments of the same type, instead of paying in cash.

Payout ratio (p) Dividend as a proportion of earnings per share.

Perpetuity. A stream of cash flows that lasts forever.

Put Option Contract that gives its holder the right to sell an asset, at a predetermined price, at any time before a certain date (American option) or only on that date (European option).

Real prices. Prices corrected for inflation.

Recurrent Cash Flows Cash Flows related only to the businesses in which the company was already present at the beginning of the year.

Relative PER The company’s PER divided by the country’s PER or the industry's PER.

Required Return to Assets (Ku) Required return to equity in the unlevered company

Required Return to Equity (Ke) The return that shareholders expect to obtain in order to feel sufficiently remunerated for the risk (also called Cost of Equity).

Residual income. After-tax profit less the opportunity cost of capital employed by the business (see also Economic Value Added and Economic Profit).

Residual value Value of the company in the last year forecasted.

Retained earnings. Earnings not paid out as dividends.

Return on assets (ROA). Accounting ratio: NOPAT divided by total assets. Also called ROI, ROCE, ROC and RONA. ROA = ROI = ROCE = ROC = RONA.

Return on Capital (ROC) See Return on assets

Return on Capital Employed (ROCE) See Return on assets

Return on equity (ROE). Accounting ratio: PAT divided by equity book value.

Return on investment (ROI). See Return on assets

Reverse valuation Consists of calculating the hypotheses that are necessary to attain the share’s price in order to then assess these hypotheses.

Risk Free Rate (R_f) Rate of return for risk-free investments (Treasury bonds). The interest rate that can be earned with certainty.

Risk premium. An expected return in excess of that on risk-free securities. The premium provides compensation for the risk of an investment.

Security market line. Graphical representation of the expected return-beta relationship of the CAPM.

Share buybacks Corporation’s purchase of its own outstanding stock.

Share repurchase. A method of cash distribution by a corporation to its shareholders in which the corporation buy shares of its stock in the stock market.

Share’s beta It measures the systematic or market risk of a share. It indicates the sensitivity of the return on a share to market movements.

Shareholder Return The shareholder value added in one year divided by the equity market value at the beginning of the year.

Shareholder Value Added The difference between the wealth held by the shareholders at the end of a given year and the wealth they held the previous year.

Shareholder Value Creation Excess return over the required return to equity multiplied by the capitalization at the beginning of the period. A company creates value for the shareholders when the shareholder return exceeds the required return to equity.

Shareholder Value Destroyer A company in which the required return to equity exceeds the shareholders return.

Specific risk. Unique risk.

Stock dividend. Dividend in the form of stock rather than cash.

Stock split. Issuance by a corporation of a given number of shares in exchange for the current number of shares held by stockholders. A reverse split decreases the number of shares outstanding.

Substantial Value Amount of investment that must be made to form a company having identical conditions as those of the company being valued.

Systematic risk. Risk factors common to the whole economy and that cannot be eliminated by diversification.

Tax Shield The lower tax paid by the company as a consequence of the interest paid on the debt in each period.

Treasury bill. Short-term, highly liquid government securities issued at a discount from the face value and returning the face amount at maturity.

Treasury bond or note. Debt obligations of the federal government that make semiannual coupon payments and are issued at or near par value.

Treasury stock. Common stock that has been repurchased by the company and held in the company’s treasury.
**Unique risk.** See unsystematic risk.

**Unlevered company’s value (Vu)** Value of the equity if a company had no debt

**Unsystematic risk.** Risk that can be eliminated by diversification. A measure of the dispersion of a random variable. Equals the expected value of the squared deviation from the mean.

**Volatility** The annualized standard deviation of the shareholder returns. It measures the share’s total risk, that is, the market risk and the diversifiable risk.

**Weighted average cost of capital before taxes (WACCBT)** Appropriate discount rate for the capital cash flow.

**Weighted average cost of capital (WACC)** Appropriate discount rate for the free cash flow.

**Working Capital Requirements (WCR)** The difference between current operational assets and current operational liabilities.

**Yield curve.** A graph of yield to maturity as function of time to maturity.

**Yield to maturity.** Internal rate of return on a bond.
